

Grow Your Own Daffodil Indoor Container (Small):

1. Fill about half to two-thirds of your chosen container/pot with compost.
2. Slowly add water to moisten the compost. Do not overwater!
3. Plant the narcissi bulbs closely for more colour.
4. Cover the bulbs with compost and then place in a cool, dark place for about 10 weeks.
5. When the shoots are 5-10cm tall, move the container into a bright spot, and water sparingly.

Extra Tip!!

- Regularly turn the pot to prevent bending towards the light.

Alternative Way to Grow Daffodils:

Narcissus bulbs such as 'Paperwhite', 'Avalanche' and 'Soleil d'Or' are easy to grow. So there is a different way to grow your narcissus:

- **Growing in water and gravel** – Fill any waterproof container with gravel or pebbles. Place your narcissus bulbs on top, keeping them close together. Then fill the container with water. Be careful that the water level does not touch, or go higher than, the base of the bulbs. Place the container in a light, but cool place, such as a windowsill. Water sparingly.
